Thermal management for
electric and hybrid vehicles

E-mobility and thermal management

How important are electric and hybrid technologies for workshops?

E-mobility is gaining further ground. According to the International Energy Agency (IEA), the growth of electric and hybrid mobility is driven primarily by government programs such as sales bonuses, local driving bans for cars with internal combustion engines, and targets for clean air. The authority considers electric vehicles to be one of several current drive technologies that can be used to achieve the long-term sustainability goals of reducing emissions.

Based on a study by management consultants PricewaterhouseCoopers, every third car registered in Europe in 2030 could be an electric car. So, it is no longer a question of whether vehicles with electric, hybrid, or even hydrogen technologies will really catch on. Rather, they will soon become part of everyday life on our streets.

These vehicles will also have to be serviced and repaired—and thus the subject of thermal management will become more complex. The temperature control of the battery and power electronics plays just as important a role in this respect as the heating and cooling of the vehicle cabin.

Air conditioning components are also required for these types of drive—and their importance is even increasing, since the air conditioning system often has a direct or indirect influence on the cooling of the batteries and electronics.

Air conditioning maintenance is therefore set to play an even more significant role in the future.

Types of electric vehicles

In addition to battery electric vehicles, there are other variants on the market that combine e-mobility and conventional combustion engines. Here's an overview:

Micro hybrids

In these vehicles, an internal combustion engine is combined with a stop-start system and a brake energy recuperation system.

Mild hybrids

These vehicles also have an additional small electric motor and a more powerful battery. The electric drive only serves as assistance when starting and for greater power delivery when overtaking ("boosting").

Full hybrids

Full hybrid vehicles can not only "boost," but also run solely on electricity. To this end, the vehicles are equipped with a full electric powertrain that requires a much more powerful battery than a mild hybrid.

Hybrids with a range extender

In hybrid vehicles with a range extender, the electricity needed to power them is generated by a small internal combustion engine. However, the combustion engine does not actually drive the vehicle.

Plug-in hybrids

Plug-in hybrids are a subtype of full hybrids. They allow the batteries to be charged overnight, for example. The positive side effect of this is that the cabin can be brought to the desired temperature at the same time.

Battery electric vehicles

These “conventional” electric vehicles are driven exclusively by the electric motor, without additional support from an internal combustion engine.

Hydrogen/fuel-cell-powered electric vehicles

The electricity needed to power such vehicles is not generated by a conventional internal combustion engine, but with the help of a fuel cell that may, for example, be operated with hydrogen as an energy carrier.

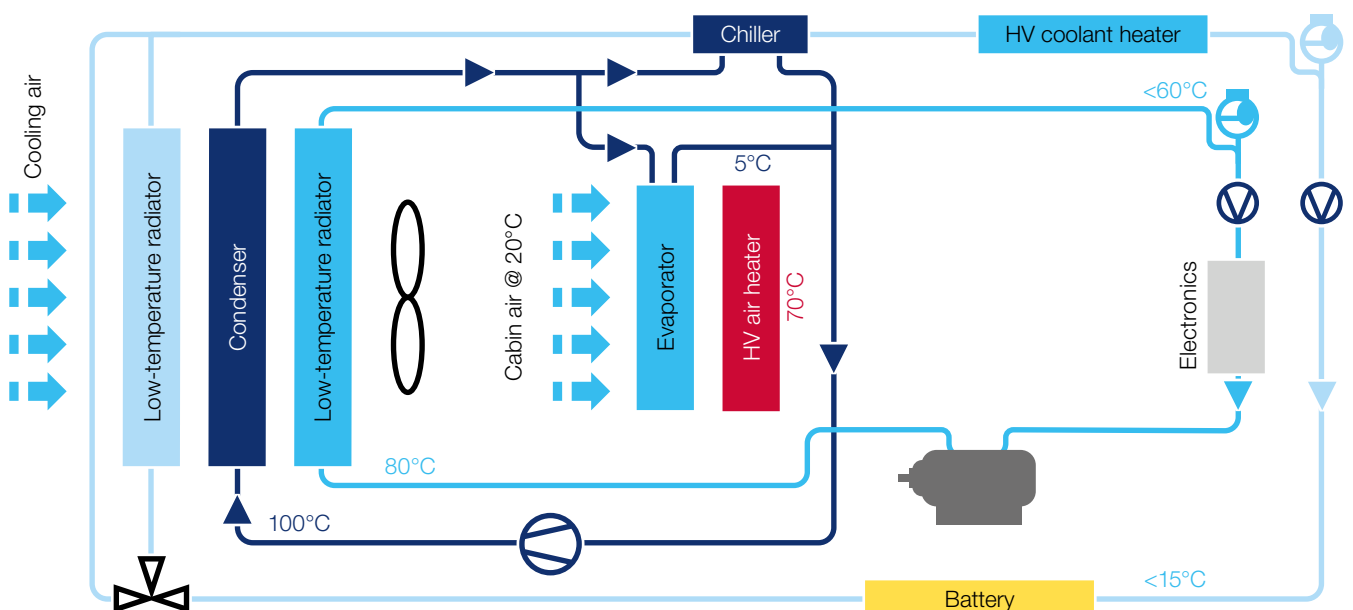

Example of a thermal management system design for electric vehicles

To enable an electric vehicle to operate at a particularly high level of efficiency, it is necessary to maintain an optimal temperature range for the electric motor, the power electronics, and the battery. This requires a sophisticated thermal management system.

In this example, the entire system is subdivided into two circuits, each comprising a separate radiator (low-temperature radiator), coolant pump, thermostat, and coolant shut-off valve. The cooling circuit responsible for the temperature control of the battery and the refrigerant circuit of the air conditioning system are integrated via a special heat exchanger (chiller). A high-voltage coolant heater provides sufficient battery temperature control at low outside temperatures. In this example, the coolant temperature for the electric motor and the power electronics is maintained at below 60°C inside a separate circuit (inner circuit on the figure) using a low-temperature radiator. To achieve full performance

while ensuring the longest possible service life, it is necessary to always maintain the coolant temperature of the battery between approximately 15°C and 30°C. When the temperature becomes too low, the coolant is heated via an auxiliary high-voltage heater. When the temperature gets too high, it is cooled via a low-temperature radiator.

Should this not suffice (during the height of summer, for example), a chiller integrated into both the coolant circuit and the refrigerant circuit further reduces the coolant temperature. Here, the refrigerant of the air conditioning system flows through the chiller and further cools down the coolant, which also flows through the chiller (indirect battery cooling via the air conditioning system). The entire control is carried out via individual thermostats, sensors, pumps, and valves.

The MAHLE e-mobility range

Due to the growing importance of e-mobility, MAHLE's range covers various components for hybrid and electric vehicles.

In addition to typical products such as radiators (for hybrid vehicles that use an internal combustion engine), MAHLE's range in this area is rounded off with specific e-mobility components, including electric air conditioning compressors, electric water pumps, and chillers.

Are all workshops permitted to service and repair electric vehicles?

All of the different forms of e-mobility have one thing in common: only specially trained workshop personnel are permitted to maintain and repair electric vehicles and their high-voltage systems (e.g., replace the electric air conditioning compressor). In Germany, for example, electricians must complete an additional two-day training course in order to obtain certification for work on high-voltage systems.

A special situation also arises when performing routine inspections and repair work (e.g., work on exhaust systems, brakes, or shock absorbers, oil change, tire change): this work may only be performed by employees who have been trained by a certified electrician for high-voltage systems on the dangers of these high-voltage systems and instructed accordingly.

Moreover, tools that comply with the specifications of the hybrid and electric vehicles must be used.

The cable for the
mobility of the future

MAHLE type 2 charging cable

The charging cable is the lifeline of your personal electric mobility. A high-quality connection between charging station and vehicle means that you can always charge your electric or hybrid vehicle safely, reliably, and at an optimal speed. Here's why you should choose the high-quality MAHLE MX 485 type 2 charging cable:

Robust original equipment quality

The MAHLE MX 485 type 2 charging cable is manufactured from high-quality components in OE quality. It is waterproof, weather-resistant (protection class IP 44), and designed for a tough everyday charging routine at temperatures from -30°C to $+50^{\circ}\text{C}$.

Optimal compatibility

All common electric and hybrid vehicles as well as charging stations and wallboxes with type 2 socket (EU standard) can be connected using the MAHLE MX 485 type 2 charging cable. And a cable length of 5 meters gives you the necessary flexibility in almost any situation.

Reliable charging

With the handy three-phase mode 3 cable, you can charge reliably and quickly with up to 22 kW of charging power and 32 amps of charging current—for over 10,000 charging cycles.

Product details

- MAHLE MX 485 type 2 charging cable, length 5 meters
- High-grade OE quality for more than 10,000 charging cycles
- EU-standard type 2 connector plug (Mennekes design), three-phase, 32 amps, 22 kW, 480 VAC, mode 3 in accordance with the IEC 62196 standard
- Waterproof, weather-resistant, and usable at temperatures from -30°C to $+50^{\circ}\text{C}$

It's your choice!

MAHLE always puts the customer's needs first. That's why we offer the most extensive premium range for automotive air conditioning and engine cooling in the independent aftermarket. PREMIUM LINE features OE-quality spare parts that are designed to last for the vehicle's entire life cycle. Even under extreme conditions, they deliver maximum output.

Premium or good standard?

PREMIUM LINE offers spare parts in top OE quality, and comprises around 4,700 products produced by MAHLE, AKG, Hanon, and other OE manufacturers.

PREMIUM LINE products in OE quality are particularly durable and deliver peak performance even under extreme conditions, making them the ideal solution for customers who expect the best.

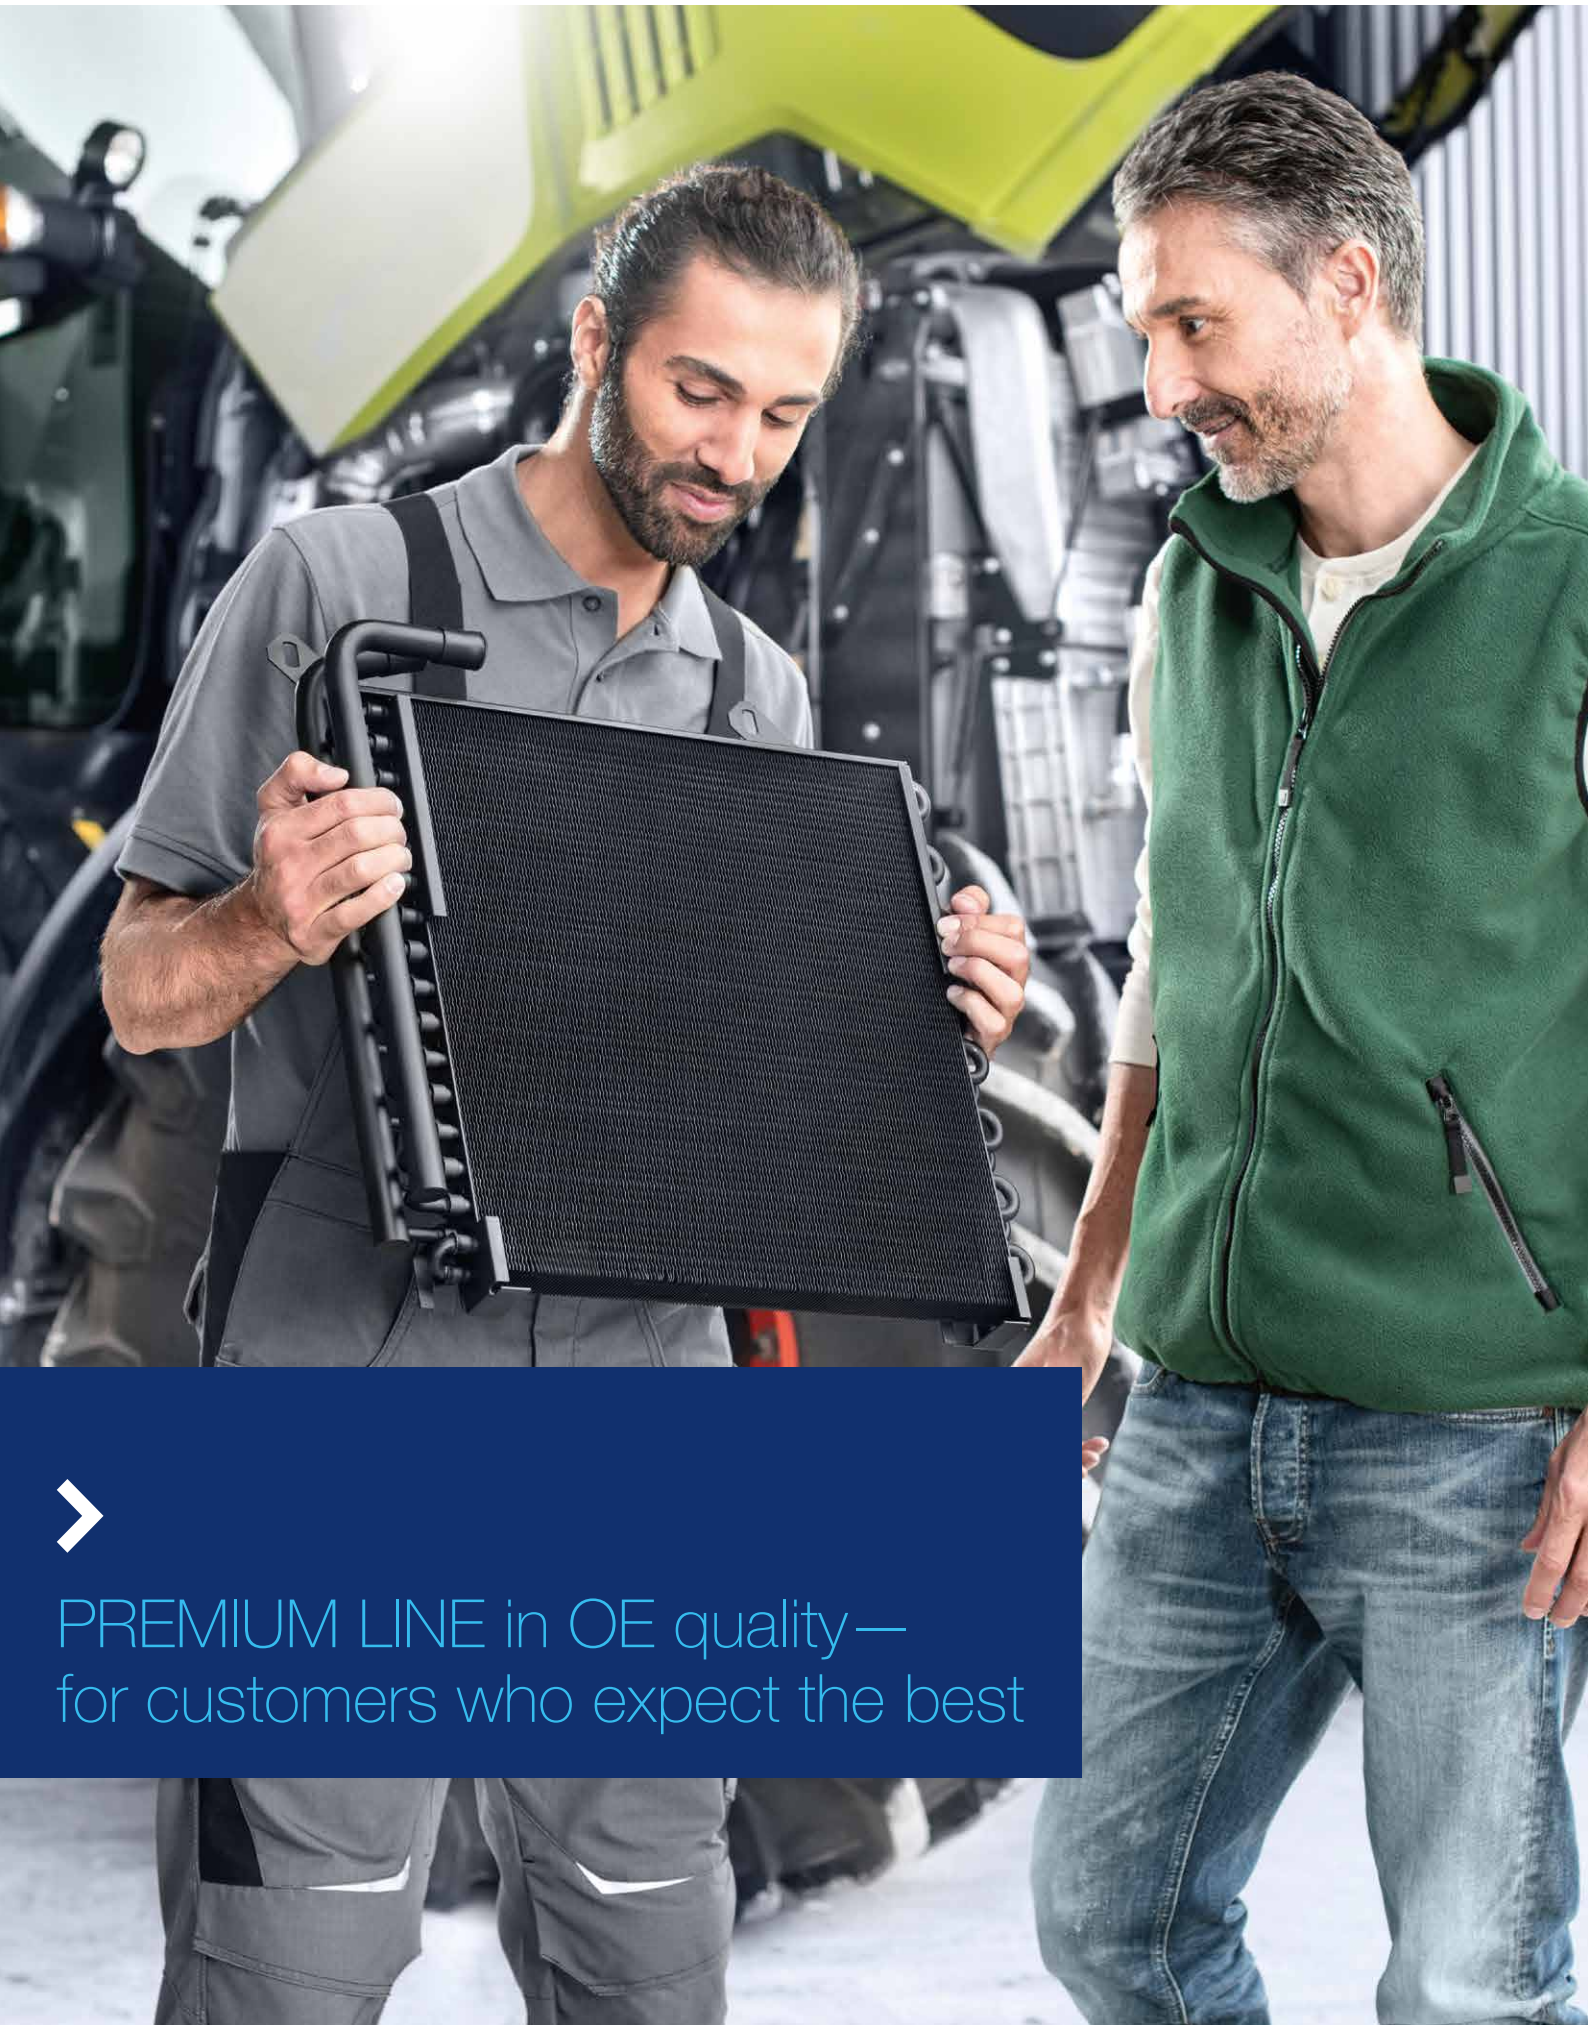

A clear difference in quality

Catalogs often show two suitable products for a specific vehicle—each PREMIUM LINE product is labeled accordingly. The PREMIUM LINE label also appears on the packaging labels and on the parts themselves. With this clear product classification, it's always obvious what's inside the carton.

The standard is always good

The approximately 3,000 standard products in OE-matching quality without the PREMIUM LINE prefix offer good performance and represent a cost-effective solution with an excellent price-performance ratio. Good quality at an attractive price. In roughly 1,200 applications, the customer can choose between premium and good standard products.

And the most important thing is that, with the right products—whether PREMIUM LINE or standard—and valuable services, you can make your customers happy and ensure that they come back time and again.

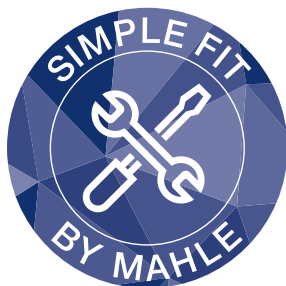

PREMIUM LINE in OE quality—
for customers who expect the best

SIMPLE FIT

The thermal management products additionally bearing the special SIMPLE FIT label contain accessories required for installation, such as O-rings, seals, screws, nuts, bolts, hose clips, etc. Not only does this save time and money, it also helps to ensure correct assembly.

Making
fitting
simple!

The installation accessories are included with products bearing this special label so that you start saving time and money as soon as you order the parts. As the accessories are supplied, you do not need to purchase them separately. Moreover, the installation accessories suitable for and supplied with the particular thermal management product ensure assembly can be carried out very easily, quickly, and correctly.

Identification is also extremely straightforward. In TecDoc and other electronic catalogs, products bearing the special SIMPLE FIT label display a separate list of the accessories included, which are also summarized above the product image. Therefore, make sure you keep an eye out for SIMPLE FIT when searching for parts!

With some 1,850 products, there's always a good solution.

Description

MAHLE

Radiator, engine cooling BEHR *** PREMIUM LINE ***

Core length: 395 mm; **core width:** 510 mm; **core depth:** 19 mm;

Radiator type: brazed cooling fins; with accessories; with screws, with sealing cover; manual transmission; for vehicles with/without A/C

Packing unit: 1

Quantity per packing unit: 1

General information:

PREMIUM LINE—OE quality for customers expecting the optimum
SIMPLE FIT—installation accessories, such as O-rings, seals, screws, nuts, bolts, and hose clips, are included with the product
